How to Take Care of an Emergency Tooth Extraction

as well as advice from dentists on how to handle an emergency tooth extraction at home or abroad. Follow these tips, and you'll be able to handle any emergency tooth extraction situation with confidence.

You never know when an **emergency tooth extraction** might happen, and you definitely don't want to be unprepared when it does. Luckily, there are steps you can take to make sure you're prepared when the time comes, as well as advice from dentists on how to handle an emergency tooth extraction at home or abroad. Follow these tips, and you'll be able to handle any emergency tooth extraction situation with confidence.

Ease the Pain

You'll want to make sure you have some pain relief on hand. If you don't have dental insurance, you can purchase a medication kit from your local pharmacy. If you do have insurance, be sure that it covers emergency **surrounding teeth hurt after tooth**

extraction ; if not, then keep in mind that it's sometimes cheaper and more convenient to purchase supplies through online vendors like Amazon. Be sure you know exactly how to use any medical equipment or medications before administering them.

Remove the Tooth

In most cases, when it comes to emergency tooth extraction, you'll need a dentist or dental surgeon to remove your tooth. This is because they have experience in dealing with extractions and have access to anesthesia that can keep you calm during and after the procedure. Depending on where you live, your dentist may not be available right away. And although tooth extraction might not be at high priority for many dentists if they aren't able or willing to remove it especially if there isn't any infection present don't let them turn you away. **same day tooth extraction near me**, find a medical center nearby that has dentists on staff who will perform emergency tooth extractions without requiring anesthesia. Then describe how a medical professional can properly pull your tooth

Ditch the Ditch

You don't need a root canal or an emergency dentist. Let nature do its thing: after you pull a tooth, just rinse your mouth with warm salt water, and bite on clean gauze for up to 10 minutes if you still feel pain. Your body will naturally coat exposed nerves with a protective film (nerve sheath). If pain is not relieved by doing so, repeat every few hours as needed. In severe cases where nerve damage remains unrelieved, you can use ibuprofen (Motrin, Advil) in conjunction with warm salt water rinses. **After 24 hour emergency dental extraction** consult your dentist for further advice. You can also follow our full guide here: [Emergency Tooth Extraction Guide](#) . Good luck!

Clean & Dress the Wound

To ensure that your extracted tooth doesn't get infected, you need to clean out any pieces of bone or tissue that may be left behind. In a pinch, use saline solution (available at most drug stores) or distilled water. Soak a cotton ball in one of these solutions and hold it against your wound until it comes away clean. If you do not have either liquid on hand, rinse your mouth with water and spit it out until there are no more particles left in your mouth. Rinse again with water as necessary and then pat dry. You can also find antibacterial rinses designed for oral wounds; if you do use one, check its expiration date before using it on yourself. Cleaning is crucial for preventing infection!

Maintain Good Oral Hygiene

Good oral hygiene is absolutely essential for maintaining strong teeth and healthy gums. Without brushing and flossing regularly, you can develop cavities, gum disease and other dental issues that leave your mouth vulnerable to infections. When one of your teeth gets a cavity, it often begins to hurt within hours or days. This can be a sign that bacteria have begun eating away at your tooth's enamel surface underneath your gums. But even if you don't experience any pain right away, it's important to see a dentist as soon as possible after noticing redness, swelling or infection in your mouth.

Infections in unsanitary conditions like these can spread quickly through your body and infect organs such as your heart, kidneys and brain. The only way to prevent complications like these is by working with a qualified dentist early on who will thoroughly clean out any infected areas while ensuring they're isolated from nearby body parts. If necessary, they may recommend oral surgery procedures like wisdom tooth removal surgery (wisdom teeth removal), gum grafts (gum restoration) or root canal therapy (root canal treatment).
