## What Are The Stages Of Periodontitis?

Millions of people across the world are suffering from gum disease or periodontal disease but are not able to identify it in the early stage which leads to the growth of bacteria in the mouth that causes tooth loss and damage of surrounding teeth. We have asked several people and found many people who don't know about **Periodontitis** in detail. For them, we have penned down almost every ounce of information related to gum disease that you should know. So make sure to read the information mentioned below carefully.

### What is Periodontitis disease?

Periodontitis disease is a serious gum infection caused in gums. The cause of periodontitis is the accumulated bacteria on your teeth and gums. Untreated periodontitis can cause severe bone damage and teeth damage. It is recommended by a **dentist open now** to get the treatment of periodontitis in the early stage for avoiding further damage to your oral health.

### What are the signs of periodontitis disease?

Here are some signs of periodontitis disease mentioned below that require an immediate visit to **24 hour emergency dentist**:

- » Bleeding gums while brushing and flossing
- » Suffering from constant prolonged
- » Severe receding gums
- » Have redness, tenderness, and swollen gums
- » Constant bad breath
- » Plaque and tartar on teeth
- » Toothache in biting and chewing

- › Bone loss
- › Tooth loss
- › Bad taste in the mouth
- › Inflammation in gums

If you are suffering from any of these symptoms and signs mentioned above then do make sure to visit the **dentist open on Saturday** for the initial consultation of gum disease.

## What are the 4 stages of periodontitis disease?

We have mentioned here are all four stages of Periodontitis disease that start as inflammation and get worse with time:

### › **Gingivitis Disease:**

The development of periodontitis starts with minor inflammation in the gums which is known as gingivitis disease. Gingivitis is the first stage of periodontitis that causes red and bleeding gums while brushing and flossing the teeth. We have found from studies some people witness discoloration on teeth due to gingivitis which is known as plaque. A plaque is a buildup of bacteria made of food debris that is stuck behind your teeth.

### › **Early Periodontal Disease:**

The early stage of periodontitis is known as receding gums in which your gum starts to recede or you suffer from tooth small pockets of abscess between your gums and teeth. The pocket is made up of abscess which starts developing when your immune system tries to offer a shield to teeth and gum to fight the infection that causes receding gums. You may face bone loss and loss during this stage of periodontitis disease.

### › **Moderate Periodontal Disease:**

If gingivitis and early-stage periodontitis are left untreated it can become a moderate periodontal disease that may cause bleeding gums serious pain and gum recession. Some people have experienced bone loss. In this stage, periodontitis starts getting spread throughout your overall body.

### › **Advanced Periodontal Disease:**

This is the most advanced stage of periodontitis disease that starts causing harm to connective tissues and making them worse

day by day. In this stage of periodontitis the gums, bones, tissues, and nerves get damage entirely that required immediate **periodontitis Treatment**. You can face severe pain while biting and chewing, bad breath, bad taste in your mouth, and can also face tooth loss.
